UX Correlator

Aternity end-user experience × NetIM infrastructure

Investigate | Slow start-ups

Username	Device	Application	Start (local)	End (local)	Match within (min)	
a.user		optional	Oct 25, 08:00 AM	Oct 28, 06:00 PM	5	Investigate

1

Likely: Outlook was not responding on LAPTOP-01 (up to 41 s)

It happened within 5 min of 3 of the 4 slow actions. Outlook failed in AddinX.dll 2.1 (inside outlook.exe 16.0): Not responding.

2

What the user felt

4 of their 37 actions were slow (Outlook 3, Teams 1), between Oct 27, 08:40 AM – Oct 28, 11:55 AM.

Slowest: **92.9 s** in Outlook, Oct 28, 11:53 AM.

Aternity measured the slow time: PC 82%, network 10%, server 8%.

Slowest start-up: Oct 27, 06:38 AM on LAPTOP-01: Machine Boot **41 s**, User Logon **33.5 s** (usual 46.1 s).

Who else is affected?

41 other PC(s) had the same failure (Outlook failing in AddinX.dll 2.1 (inside outlook.exe 16.0)), all on 2.1. This PC has 2.1.

Searched: every PC's health events for Outlook, Oct 25, 08:00 AM – Oct 28, 06:00 PM.

Hide who

3

PC	User	Version	Times	Last seen
LAPTOP-17	b.user	2.1	9	Oct 28, 04:12 PM
LAPTOP-22	c.user	2.1	6	Oct 28, 11:03 AM
DESKTOP-04	d.user	2.1	4	Oct 27, 02:47 PM

… and 38 more

What we found, and why

4

• Outlook was not responding on LAPTOP-01 (up to 41 s): **at 3 of 4 slow actions**, from Oct 27, 08:40 AM

> **Why:**
> ◦ Outlook failed in AddinX.dll 2.1 (inside outlook.exe 16.0): Not responding.
> ◦ Changed on LAPTOP-01 in the 14 days before Oct 27: Oct 26 AddinX Updated 2.0 → 2.1 (same name as the failing part).

• LAPTOP-01's disk could not keep up (queue 6.2, limit 2): **at 2 of 4 slow actions**, from Oct 27, 08:41 AM

> **Why:** ◦ Busiest processes then: MsMpEng.exe (disk I/O 48.2), OneDrive.exe (disk I/O 6.1).

• 9 other problem(s) happened only at other times, not near a slow action.
• The network was not checked: this PC's address is not in any NetIM subnet.

What to do

• 41 other PCs fail the same way: treat it as an AddinX.dll problem (version, update, vendor), not this PC alone.
• Check the AddinX change of 2026-10-26 on LAPTOP-01: it came before the first failure.
• On LAPTOP-01: look at MsMpEng.exe, the busiest process at those times.

Timeline

7

Slow = Aternity marked it Major.
A problem counts for a slow action recorded up to 5 min before or after it. A crash, hang or health event of one application counts only for that application.
Aternity UXI: avg 7.9, lowest 4.1.

LAPTOP-01 Not Mapped · Windows 11 | NetIM object checked: none on this PC's path.

How to use it

1. Fill in a user name or a device (or both), the time range and, if you like, one application. 'Match within' = how many minutes before or after a slow action a problem still counts. Click Investigate: a progress list shows each step until the result appears.
2. The answer: the problem seen at the most slow actions. Red edge = Likely (more than half), amber = Possibly, grey = Cause not found, green = nothing was slow.
3. Who else is affected? For an app failure: how many other PCs had the same failure, and on which version. 'Show who' opens the list below (PC, user, version, times, last seen); click again to close. For a network problem it lists the other slow users and the network point they share instead.
4. The main part: each problem at the slow actions, and under it what caused it, from Aternity's own records: where the app failed (module and version), whether other PCs fail the same way, what was installed or updated before, and the busiest processes. 'What to do' follows from these.
5. Every action as a dot (red = slow) and every problem as a mark in its lane. A solid mark is near a slow action; a faded one is not. Hover any dot or mark for its date, time and value.
6. Only the problems at slow actions, with 'at N of M'. 'Show N problem(s) at other times' opens the rest; click again to close.
7. Closed at first. Opens the rules used, the PC and the NetIM objects checked. Click again to close.
