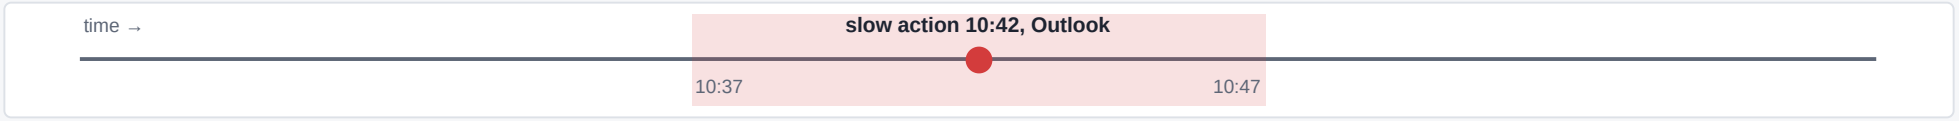
How a problem is matched to a slow action (Match within = 5 min)



PC	10:40 Outlook not responding	Counts: same app, inside the window
PC	10:41 Notepad crashed	Doesn't count: another application
PC	10:44 CPU 95% (limit 85)	Counts: CPU slows every app
Network	10:45 Branch router Gi0/1 utilization 97%	Counts: inside the window
PC	11:30 Disk queue 6 (limit 2)	Doesn't count: 48 min later

Each problem gets a count: **at N of M slow actions**.

The one at the most slow actions is the answer: **Likely** if more than half, **Possibly** if fewer.

A crash, hang or health event of one application counts only for that application's slow actions. CPU, memory, disk, network and server problems count for every app. Values are examples.
